

# Suicides in England

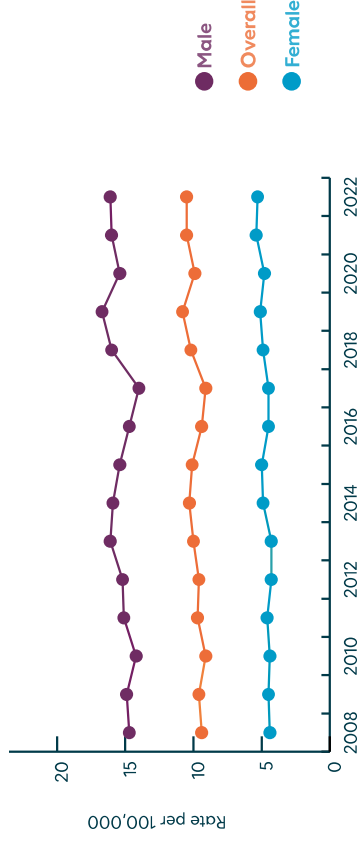

The overall, male, and female suicide rates in England have remained similar to 2021. Males are 3 times more likely to die by suicide in England than females.

## Age groups with highest suicide rate per 100,000

Males aged 90 years or over had the highest suicide rate, at 30.4 deaths per 100,000. However, we have to be cautious in interpreting this, as it is based on a relatively low number of actual deaths (52) which fluctuate year on year. The second highest rate for males was in those aged 50 to 54, which has remained consistently high for decades.

## Suicide rate per 100,000 in England 2008-2022

Notes about data: Data source – Office for National Statistics (ONS). Suicide refers to deaths where the underlying cause is **intentional self-harm** and **events of undetermined intent**. Data represents suicide registrations. Increases/decreases are based on one year of data. These may not indicate longer term trends and may not be statistically significant. Overall rates for male, female and all persons are age standardised. Rates broken down by age group are crude.

Source: Office for National Statistics.

It is ONS best practice not to calculate rates based on such small numbers, as they are imprecise and susceptible to inaccurate interpretation. Age-specific rates based on less than 20 deaths are marked with a “\*” to warn users that their reliability is low.
